Per-Tool Respondent Comparison 6 of 6 tools

ReMynd Attention & Self-Regulation Scale (RASR) — Observer Version — 3 respondents

Bars colored by risk band · Bar order (L→R): 1. Teacher 1 2. Teacher 2 3. Parent

● Low (0–25) ● Mild (26–50) ● Moderate (51–65) ● Elevated (66–100)

△ Significant discrepancy (≥1.5 raw pts):

Distractibility (2.1 raw pts)

Sustained Attention (2.3 raw pts)

ReMynd Comprehensive Educational Profile — Tier 2 Core (RCEP-Core)

— 3 respondents

Bars colored by risk band · Bar order (L→R): 1. Parent 2. Teacher 1 3. Teacher 2

● Low (0–25) ● Mild (26–50) ● Moderate (51–65) ● Elevated (66–100)

 ReMynd Emotional Regulation & Mood Scale — 3 respondents

Bars colored by risk band · Bar order (L→R): 1. Parent 2. Teacher 1 3. Teacher 2

● Low (0–25) ● Mild (26–50) ● Moderate (51–65) ● Elevated (66–100)

△ Significant discrepancy (≥1.5 raw pts): Mood Variability (2.0 raw pts) Frustration Tolerance (2.3 raw pts)
Recovery & Regulation (2.1 raw pts)

 ReMynd Academic Resilience and Performance Scale (RARPS) — 2 respondents

Bars colored by risk band · Bar order (L→R): 1. Teacher 1 2. Teacher 2

● Low (0–25) ● Mild (26–50) ● Moderate (51–65) ● Elevated (66–100)

△ Significant discrepancy (≥1.5 raw pts): Help Seeking (2.5 raw pts)

Emotional Response Learning (1.7 raw pts)

ReMynd Social Competency Profile (RSCP) — 3 respondents

Bars colored by risk band · Bar order (L→R): 1. Parent 2. Teacher 1 3. Teacher 2

● Low (0–25) ● Mild (26–50) ● Moderate (51–65) ● Elevated (66–100)

ReMynd Functional Impact Index (RFII) — 2 respondents

Bars colored by risk band · Bar order (L→R): 1. Self-Report 2. Parent

 Cross-Informant Discrepancy Analysis

Domains where respondents disagree most (raw domain spread ≥ 1.5 pts flagged; chart shows normalized equivalent).

Orange = clinically significant discrepancy (raw spread ≥ 1.5 pts). Grey = within acceptable range.

 AI Clinical Interpretation

Cayline Yining Cheng, a third-grade student at QSI International Chengdu, was referred for a comprehensive psychoeducational assessment due to concerns raised by her mother, with additional data gathered from two classroom teachers and Cayline herself. The cross-informant and cross-tool data from the ReMynd Assessment Operating System (RAOS) reveal a functional profile characterized by significant, elevated challenges in executive functioning and task initiation, coupled with moderate difficulties in sustained attention, avoidance patterns, and social communication. The ReMynd Index, which aggregates scores across all respondents, places Executive Functioning at 80/100 and Task Initiation at 79/100, both in the Elevated range, indicating that these are the most pervasive and impactful areas of concern. These are closely followed by Functional Impact (72/100, Moderate), Avoidance Patterns (71/100, Elevated), and Sustained Attention (61/100, Moderate), suggesting that Cayline's cognitive regulation difficulties are not isolated but rather permeate her daily academic and social experiences.

The per-domain analysis reveals a complex pattern of convergent and divergent findings across informants, which is essential for interpreting the data accurately. In the domain of task initiation and sustained attention, there is notable disagreement. Teacher 1 reports significant concerns (Task Initiation 70/100, Sustained Attention

70/100), while Teacher 2 reports a much lower concern for sustained attention (28/100) but a very high concern for task initiation (83/100). The parent report aligns with Teacher 2 on task initiation (83/100) but is the most elevated on sustained attention (85/100). This suggests that while task initiation is consistently a struggle across settings, sustained attention may be more context-dependent, possibly influenced by task demands or environmental structure. Conversely, impulse regulation is uniformly rated as a low concern across all respondents (scores of 13, 0, and 3), indicating that Cayline's difficulties are not rooted in behavioral disinhibition but rather in the cognitive processes of getting started and maintaining focus. In the emotional domain, avoidance patterns are consistently elevated across parent and Teacher 1 (85/100 and 75/100, respectively), while Teacher 2 rates this lower (53/100). This discrepancy may reflect that avoidance behaviors are more pronounced in certain academic subjects or during specific times of day, or that Teacher 2 observes Cayline in a context that is less demanding and therefore less likely to trigger avoidant responses.

Contextual factors are critical for explaining these discrepancies. The differences between Teacher 1 and Teacher 2 ratings likely reflect varying classroom structures, instructional styles, and the nature of the academic tasks presented. For instance, Teacher 1 may have a less structured environment or require more independent work, which would exacerbate difficulties with task initiation and sustained attention. Teacher 2, alternatively, may provide more frequent prompts or use a more engaging, hands-on approach that supports Cayline's focus. The parent's elevated ratings for sustained attention may reflect the home environment, where homework completion requires self-directed effort without the external structure of a classroom. Additionally, the RCEP-Core data shows that while executive functioning is rated as elevated by all informants (73, 78, and 90), protective factors are rated in the Mild range (35, 50, 55), suggesting that while Cayline has some internal and external supports, they are not currently sufficient to mitigate her challenges. The low ratings on emotional intensity and mood variability across most informants indicate that her emotional dysregulation is not explosive or volatile; rather, it manifests as internalizing avoidance and frustration, which aligns with the elevated scores on Frustration Tolerance (54/100) and Avoidance Patterns (71/100).

The functional implications of these data are substantial for Cayline's academic performance, social engagement, and daily functioning. Academically, her elevated executive functioning and task initiation scores suggest she will struggle to begin assignments, organize her materials, and persist through multi-step tasks, which is corroborated by the RARPS showing low academic persistence and motivation/engagement. Her low academic self-belief (29/100) further indicates that she may have internalized these struggles, leading to a cycle of avoidance and reduced effort. Socially, the RSCP data reveals low social confidence and peer relationship scores, with the parent and Teacher 2 both noting significant concerns in

social functioning (75/100 and 60/100 on the RFII). While her social communication is rated as a moderate concern (56/100), the low social awareness and empathy/prosocial scores suggest she may struggle to read social cues or initiate interactions, potentially leading to isolation. In terms of daily functioning, the parent reports significant impact on academic functioning (70/100) and social functioning (75/100), while Cayline herself reports moderate impacts across all domains. This discrepancy suggests that while Cayline may not fully perceive the extent of her difficulties, her parent observes clear functional impairments that affect her ability to navigate her day-to-day life effectively.

Given the complexity of this profile, it is recommended that the assessment process continue with targeted clinical interviews with both Cayline and her parents to explore the nature of her avoidance patterns and any underlying anxiety features, which are rated in the Mild range but may be contributing to her task avoidance. A structured classroom observation, particularly during independent work periods, would provide valuable data on the specific environmental triggers and supports that influence her task initiation and sustained attention. Furthermore, a diagnostic formulation should consider whether Cayline's profile is consistent with an attention-deficit/hyperactivity disorder, predominantly inattentive presentation, given the marked difficulties with task initiation, sustained attention, and executive functioning in the absence of hyperactivity or impulsivity. Additionally, the moderate anxiety features and high avoidance patterns warrant exploration for a possible co-occurring anxiety disorder, as these can significantly compound academic and social difficulties. The next steps should involve a collaborative meeting with the school team to develop a targeted intervention plan focusing on executive function coaching, breaking tasks into smaller chunks, and building academic self-efficacy, while also considering a referral for a medical evaluation to rule out or confirm an attention disorder.
