ReMynd Attention & Self-Regulation Scale (RASR) — Observer Version — 3 respondents

Bars colored by risk band · Bar order (L→R): 1. Teacher 1 2. Teacher 2 3. Parent

Low (0-25) Mild (26-50) Moderate (51-65) Elevated (66-100)

Significant discrepancy (≥1.5 raw pts):

Distractibility (2.1 raw pts)

Sustained Attention (2.3 raw pts)

CLINICAL INTERPRETATION

The ReMynd Attention & Self-Regulation Scale (RASR) Observer Version was completed by two teachers and Cayline's parent/guardian, yielding notable variability across respondents. Teacher 1 reported elevated concerns in Distractibility (73/100), Task Initiation (70/100), and Sustained Attention (70/100), while rating Impulse Regulation as low (13/100) and Behavioral Modulation in the mild range (38/100). Teacher 2, in contrast, reported low Distractibility (20/100), very low Impulse Regulation (0/100), and low Behavioral Modulation (8/100), but identified Task Initiation as highly elevated (83/100) and Sustained Attention in the low-mild range (28/100). Parent ratings showed elevated Task Initiation (83/100) and Sustained Attention (85/100), moderate Distractibility (48/100), and low Impulse Regulation (3/100), with Behavioral Modulation at 38/100. Across respondents, Task Initiation emerges as a consistent area of elevated concern, with all three informants endorsing significant difficulty in this domain; however, substantial disagreement exists regarding Distractibility and Sustained Attention, with Teacher 1 and Parent reporting high concern while Teacher 2 observes minimal difficulty. This discrepancy may reflect setting-specific demands or variability in Cayline's attentional presentation across different classroom contexts. Impulse Regulation is uniformly rated as low concern, suggesting that behavioral disinhibition is not a

primary difficulty. The pattern suggests Cayline’s attentional challenges are most pronounced in task initiation and sustained engagement, rather than in impulse control or behavioral regulation.

 ReMynd Comprehensive Educational Profile — Tier 2 Core (RCEP-Core) — 3 respondents

Bars colored by risk band · Bar order (L→R): 1. Parent 2. Teacher 1 3. Teacher 2

 CLINICAL INTERPRETATION

The ReMynd Comprehensive Educational Profile — Tier 2 Core (RCEP-Core) was completed by Cayline’s parent/guardian and two teachers, revealing a broadly consistent picture of elevated functional impact and executive functioning difficulties. Parent ratings indicated elevated Functional Impact (68/100), Executive Functioning (73/100), Attention Regulation (65/100), and Social Communication (90/100), with Protective Factors in the mild range (35/100). Teacher 1 reported elevated Functional Impact (73/100) and Executive Functioning (78/100), with moderate Attention Regulation (53/100) and Social Communication (90/100). Teacher 2 rated Functional Impact highest at 75/100 and Executive Functioning at 90/100 (elevated), while Attention Regulation was moderate (43/100) and Social Communication elevated at 85/100. All three respondents converge on elevated Functional Impact and Executive Functioning, indicating that Cayline’s daily functioning is significantly affected by cognitive and organizational demands. Social Communication is consistently rated in the elevated range across all informants, suggesting meaningful difficulties in social interaction and communication that are observable across home and school settings. Attention Regulation shows moderate-to-elevated ratings across respondents, reinforcing the attentional concerns identified on the RASR. Emotional Regulation was rated mild-to-moderate (40–48/100), and Academic Persistence was moderate across informants (50–60/100), suggesting that while motivation and emotional stability are relatively preserved, the cumulative impact of executive and attentional difficulties significantly compromises Cayline’s school functioning.

 ReMynd Emotional Regulation & Mood Scale — 3 respondents

Bars colored by risk band · Bar order (L→R): 1. Parent 2. Teacher 1 3. Teacher 2

CLINICAL INTERPRETATION

The ReMynd Emotional Regulation & Mood Scale was completed by Cayline's parent/guardian and two teachers, revealing significant discrepancies in perceived emotional functioning. Parent ratings indicated elevated Avoidance Patterns (85/100) and Frustration Tolerance concerns (68/100), with moderate Anxiety Features (50/100) and low Mood Variability (28/100), Emotional Intensity (18/100), and Recovery & Regulation (28/100). Teacher 1 reported elevated Avoidance Patterns (75/100) and Frustration Tolerance (75/100), with moderate Anxiety Features (50/100), Mood Variability (53/100), Emotional Intensity (43/100), and Recovery & Regulation (60/100). Teacher 2, however, reported markedly lower concerns across most domains, with Avoidance Patterns moderate (53/100), and all other scales in the low range (Anxiety Features 48/100, Mood Variability 3/100, Emotional Intensity 8/100, Frustration Tolerance 18/100, Recovery & Regulation 8/100). The most striking convergence across Parent and Teacher 1 is the elevated Avoidance Patterns, suggesting that Cayline may engage in avoidance behaviors as a coping strategy, potentially in response to academic or social demands. The substantial discrepancy between Teacher 2 and the other two informants on Frustration Tolerance, Mood Variability, and Recovery & Regulation may indicate that Cayline's emotional dysregulation is more pronounced in certain settings or with certain adults, or that Teacher 2 observes a more stable emotional presentation. Anxiety Features are consistently rated in the mild-to-moderate range across all respondents, suggesting a baseline level of anxiety that may underpin the avoidance patterns.

ReMynd Academic Resilience and Performance Scale (RARPS) — 2 respondents

Bars colored by risk band · Bar order (L→R): 1. Teacher 1 2. Teacher 2

CLINICAL INTERPRETATION

The ReMynd Academic Resilience and Performance Scale (RARPS) was completed by two teachers, revealing notable inconsistencies in their perceptions of Cayline’s academic resilience. Teacher 1 rated Help-Seeking as elevated (75/100), with Academic Persistence moderate (45/100), and low ratings for Academic Self-Belief (25/100), Motivation & Engagement (20/100), Emotional Response to Learning (20/100), and Executive Function in Academic Contexts (13/100). Teacher 2, in contrast, rated Help-Seeking as low (13/100) and Academic Persistence as low (13/100), with Academic Self-Belief mild (33/100), Motivation & Engagement low (25/100), Emotional Response to Learning elevated (63/100), and Executive Function in Academic Contexts low (20/100). The disagreement between teachers on Help-Seeking is particularly notable — Teacher 1 sees Cayline as actively seeking assistance, while Teacher 2 perceives minimal help-seeking behavior. This may reflect different classroom structures, teacher responsiveness, or Cayline’s differential comfort in seeking help from specific adults. Both teachers agree that Academic Self-Belief and Motivation & Engagement are low-to-mild concerns, suggesting that Cayline’s academic confidence and intrinsic motivation are areas of vulnerability. Teacher 2’s elevated rating of Emotional Response to Learning (63/100) suggests that academic tasks may trigger significant emotional reactions, consistent with the avoidance patterns noted on the Emotional Regulation & Mood Scale. Executive Function in Academic Contexts is rated low by both teachers, which is somewhat inconsistent with the elevated Executive Functioning scores on the RCEP-Core, possibly reflecting different operationalizations of executive function across instruments.

ReMynd Social Competency Profile (RSCP) — 3 respondents

Bars colored by risk band · Bar order (L→R): 1. Parent 2. Teacher 1 3. Teacher 2

CLINICAL INTERPRETATION

The ReMynd Social Competency Profile (RSCP) was completed by Cayline’s parent/guardian and two teachers, revealing generally low-to-mild concerns across social domains, with some notable exceptions. Social Awareness was rated low across all respondents (13–25/100), Empathy & Prosocial Behavior was low-to-mild (25–38/100), and Social Confidence was low across all (13–33/100). Peer Relationships were rated low by Parent (38/100) and Teacher 1 (25/100), and low by Teacher 2 (13/100). Social Communication was rated low-to-mild across respondents (20–25/100). Emotional Regulation in Social Contexts showed the most variability: Parent rated this at 38/100 (mild), Teacher 1 at 25/100 (low), and Teacher 2 at 50/100 (mild). The overall pattern on this instrument suggests that Cayline’s social competency difficulties are relatively mild compared to the elevated Social Communication scores on the RCEP-Core. This discrepancy may indicate that while Cayline experiences significant challenges in social communication as a broader construct, specific social skills such as awareness, empathy, and confidence are less impaired. The low Social Confidence ratings across all informants suggest that Cayline may lack self-assurance in social situations, which could contribute to avoidance patterns observed in other instruments. The low Peer Relationships scores indicate that while Cayline may have some peer connections, these relationships may be limited in depth or frequency. Overall, the RSCP suggests that social difficulties exist but are not uniformly severe, with social confidence and peer engagement being the most vulnerable areas.

ReMynd Functional Impact Index (RFII) — 2 respondents

Bars colored by risk band · Bar order (L→R): 1. Self-Report 2. Parent

CLINICAL INTERPRETATION

The ReMynd Functional Impact Index (RFII) was completed by Cayline as a self-report and by her parent/guardian, revealing meaningful differences in perceived functional impairment. Cayline's self-ratings were relatively moderate across all domains: Daily Functioning (38/100), Social Functioning (45/100), Academic Functioning (45/100), School Participation (38/100), Emotional Functioning (38/100), and Behavioral Functioning (38/100). Parent ratings, however, showed a more differentiated pattern: Social Functioning was rated highly elevated (75/100), Academic Functioning elevated (70/100), Daily Functioning moderate (45/100), with School Participation (20/100), Emotional Functioning (20/100), and Behavioral Functioning (8/100) rated as low concerns. The discrepancy between Cayline's self-perception and her parent's perception is most pronounced in Social Functioning and Academic Functioning, where the parent sees significantly greater impairment than Cayline reports. This may indicate that Cayline has limited insight into her difficulties, or that she experiences these challenges as less distressing than her parent observes. Conversely, both agree that Behavioral Functioning is a relatively low concern. The parent's low ratings of School Participation and Emotional Functioning suggest that while school attendance and emotional well-being are not major concerns, social and academic functioning are areas of significant impact. This pattern suggests that Cayline may be experiencing substantial social and academic challenges that are more visible to her parent than to herself, potentially reflecting an avoidant or minimizing coping style.

Orange = clinically significant discrepancy (raw spread ≥ 1.5 pts). Grey = within acceptable range.

Clinical Interpretation

REMYND ATTENTION & SELF-REGULATION SCALE (RASR) — OBSERVER VERSION

The ReMynd Attention & Self-Regulation Scale (RASR) Observer Version was completed by two teachers and Cayline’s parent/guardian, yielding notable variability across respondents. Teacher 1 reported elevated concerns in Distractibility (73/100), Task Initiation (70/100), and Sustained Attention (70/100), while rating Impulse Regulation as low (13/100) and Behavioral Modulation in the mild range (38/100). Teacher 2, in contrast, reported low Distractibility (20/100), very low Impulse Regulation (0/100), and low Behavioral Modulation (8/100), but identified Task Initiation as highly

elevated (83/100) and Sustained Attention in the low-mild range (28/100). Parent ratings showed elevated Task Initiation (83/100) and Sustained Attention (85/100), moderate Distractibility (48/100), and low Impulse Regulation (3/100), with Behavioral Modulation at 38/100. Across respondents, Task Initiation emerges as a consistent area of elevated concern, with all three informants endorsing significant difficulty in this domain; however, substantial disagreement exists regarding Distractibility and Sustained Attention, with Teacher 1 and Parent reporting high concern while Teacher 2 observes minimal difficulty. This discrepancy may reflect setting-specific demands or variability in Cayline's attentional presentation across different classroom contexts. Impulse Regulation is uniformly rated as low concern, suggesting that behavioral disinhibition is not a primary difficulty. The pattern suggests Cayline's attentional challenges are most pronounced in task initiation and sustained engagement, rather than in impulse control or behavioral regulation.

REMYND COMPREHENSIVE EDUCATIONAL PROFILE — TIER 2 CORE (RCEP-CORE)

The ReMynd Comprehensive Educational Profile — Tier 2 Core (RCEP-Core) was completed by Cayline's parent/guardian and two teachers, revealing a broadly consistent picture of elevated functional impact and executive functioning difficulties. Parent ratings indicated elevated Functional Impact (68/100), Executive Functioning (73/100), Attention Regulation (65/100), and Social Communication (90/100), with Protective Factors in the mild range (35/100). Teacher 1 reported elevated Functional Impact (73/100) and Executive Functioning (78/100), with moderate Attention Regulation (53/100) and Social Communication (90/100). Teacher 2 rated Functional Impact highest at 75/100 and Executive Functioning at 90/100 (elevated), while Attention Regulation was moderate (43/100) and Social Communication elevated at 85/100. All three respondents converge on elevated Functional Impact and Executive Functioning, indicating that Cayline's daily functioning is significantly affected by cognitive and organizational demands. Social Communication is consistently rated in the elevated range across all informants, suggesting meaningful difficulties in social interaction and communication that are observable across home and school settings. Attention Regulation shows moderate-to-elevated ratings across respondents, reinforcing the attentional concerns identified on the RASR. Emotional Regulation was rated mild-to-moderate (40–48/100), and Academic Persistence was moderate across informants (50–60/100), suggesting that while motivation and emotional stability are relatively preserved, the cumulative impact of executive and attentional difficulties significantly compromises Cayline's school functioning.

REMYND EMOTIONAL REGULATION & MOOD SCALE

The ReMynd Emotional Regulation & Mood Scale was completed by Cayline's parent/guardian and two teachers, revealing significant discrepancies in perceived emotional functioning. Parent ratings indicated elevated Avoidance Patterns (85/100) and Frustration Tolerance concerns (68/100), with moderate Anxiety Features (50/100) and low Mood Variability (28/100), Emotional Intensity (18/100), and Recovery & Regulation (28/100). Teacher 1 reported elevated Avoidance Patterns (75/100) and Frustration Tolerance (75/100), with moderate Anxiety Features (50/100), Mood Variability (53/100), Emotional Intensity (43/100), and Recovery & Regulation (60/100). Teacher 2, however, reported markedly lower concerns across most domains, with Avoidance Patterns moderate (53/100), and all other scales in the low range (Anxiety Features 48/100, Mood Variability 3/100, Emotional Intensity 8/100, Frustration Tolerance 18/100, Recovery & Regulation 8/100). The most striking convergence across Parent and Teacher 1 is the elevated Avoidance Patterns, suggesting that Cayline may engage in avoidance behaviors as a coping strategy, potentially in response to academic or social demands. The substantial discrepancy between Teacher 2 and the other two informants on Frustration Tolerance, Mood Variability, and Recovery & Regulation may indicate that Cayline's emotional dysregulation is more pronounced in certain settings or with certain adults, or that

Teacher 2 observes a more stable emotional presentation. Anxiety Features are consistently rated in the mild-to-moderate range across all respondents, suggesting a baseline level of anxiety that may underpin the avoidance patterns.

REMYND ACADEMIC RESILIENCE AND PERFORMANCE SCALE (RARPS)

The ReMynd Academic Resilience and Performance Scale (RARPS) was completed by two teachers, revealing notable inconsistencies in their perceptions of Cayline's academic resilience. Teacher 1 rated Help-Seeking as elevated (75/100), with Academic Persistence moderate (45/100), and low ratings for Academic Self-Belief (25/100), Motivation & Engagement (20/100), Emotional Response to Learning (20/100), and Executive Function in Academic Contexts (13/100). Teacher 2, in contrast, rated Help-Seeking as low (13/100) and Academic Persistence as low (13/100), with Academic Self-Belief mild (33/100), Motivation & Engagement low (25/100), Emotional Response to Learning elevated (63/100), and Executive Function in Academic Contexts low (20/100). The disagreement between teachers on Help-Seeking is particularly notable — Teacher 1 sees Cayline as actively seeking assistance, while Teacher 2 perceives minimal help-seeking behavior. This may reflect different classroom structures, teacher responsiveness, or Cayline's differential comfort in seeking help from specific adults. Both teachers agree that Academic Self-Belief and Motivation & Engagement are low-to-mild concerns, suggesting that Cayline's academic confidence and intrinsic motivation are areas of vulnerability. Teacher 2's elevated rating of Emotional Response to Learning (63/100) suggests that academic tasks may trigger significant emotional reactions, consistent with the avoidance patterns noted on the Emotional Regulation & Mood Scale. Executive Function in Academic Contexts is rated low by both teachers, which is somewhat inconsistent with the elevated Executive Functioning scores on the RCEP-Core, possibly reflecting different operationalizations of executive function across instruments.

REMYND SOCIAL COMPETENCY PROFILE (RSCP)

The ReMynd Social Competency Profile (RSCP) was completed by Cayline's parent/guardian and two teachers, revealing generally low-to-mild concerns across social domains, with some notable exceptions. Social Awareness was rated low across all respondents (13–25/100), Empathy & Prosocial Behavior was low-to-mild (25–38/100), and Social Confidence was low across all (13–33/100). Peer Relationships were rated low by Parent (38/100) and Teacher 1 (25/100), and low by Teacher 2 (13/100). Social Communication was rated low-to-mild across respondents (20–25/100). Emotional Regulation in Social Contexts showed the most variability: Parent rated this at 38/100 (mild), Teacher 1 at 25/100 (low), and Teacher 2 at 50/100 (mild). The overall pattern on this instrument suggests that Cayline's social competency difficulties are relatively mild compared to the elevated Social Communication scores on the RCEP-Core. This discrepancy may indicate that while Cayline experiences significant challenges in social communication as a broader construct, specific social skills such as awareness, empathy, and confidence are less impaired. The low Social Confidence ratings across all informants suggest that Cayline may lack self-assurance in social situations, which could contribute to avoidance patterns observed in other instruments. The low Peer Relationships scores indicate that while Cayline may have some peer connections, these relationships may be limited in depth or frequency. Overall, the RSCP suggests that social difficulties exist but are not uniformly severe, with social confidence and peer engagement being the most vulnerable areas.

REMYND FUNCTIONAL IMPACT INDEX (RFII)

The ReMynd Functional Impact Index (RFII) was completed by Cayline as a self-report and by her parent/guardian, revealing meaningful differences in perceived functional impairment. Cayline's self-ratings were relatively moderate across all domains: Daily Functioning (38/100), Social

Functioning (45/100), Academic Functioning (45/100), School Participation (38/100), Emotional Functioning (38/100), and Behavioral Functioning (38/100). Parent ratings, however, showed a more differentiated pattern: Social Functioning was rated highly elevated (75/100), Academic Functioning elevated (70/100), Daily Functioning moderate (45/100), with School Participation (20/100), Emotional Functioning (20/100), and Behavioral Functioning (8/100) rated as low concerns. The discrepancy between Cayline's self-perception and her parent's perception is most pronounced in Social Functioning and Academic Functioning, where the parent sees significantly greater impairment than Cayline reports. This may indicate that Cayline has limited insight into her difficulties, or that she experiences these challenges as less distressing than her parent observes. Conversely, both agree that Behavioral Functioning is a relatively low concern. The parent's low ratings of School Participation and Emotional Functioning suggest that while school attendance and emotional well-being are not major concerns, social and academic functioning are areas of significant impact. This pattern suggests that Cayline may be experiencing substantial social and academic challenges that are more visible to her parent than to herself, potentially reflecting an avoidant or minimizing coping style.

o CROSS-INSTRUMENT CLINICAL SUMMARY

The ReMynd Assessment Operating System (RAOS) battery administered to Cayline Yining Cheng included six instruments — the ReMynd Attention & Self-Regulation Scale (RASR) Observer Version, ReMynd Comprehensive Educational Profile — Tier 2 Core (RCEP-Core), ReMynd Emotional Regulation & Mood Scale, ReMynd Academic Resilience and Performance Scale (RARPS), ReMynd Social Competency Profile (RSCP), and ReMynd Functional Impact Index (RFII) — completed by two teachers, her parent/guardian, and Cayline herself. Across this multi-informant, multi-instrument battery, a coherent picture emerges of a third-grade student who presents with significant executive functioning and attentional difficulties, particularly in task initiation and sustained attention, which are exerting a substantial impact on her academic and social functioning. The cross-tool data converge on a profile characterized by elevated executive dysfunction, avoidance patterns, and functional impairment, while impulse regulation and behavioral modulation emerge as relative strengths. This pattern is consistent with a student who struggles not with behavioral control but with the cognitive and motivational demands of initiating and sustaining effortful tasks.

The most striking convergent theme across instruments is the elevation of Executive Functioning (ReMynd Index average 80/100, Elevated) and Task Initiation (79/100, Elevated), which are consistently endorsed by all three adult respondents across the RASR and RCEP-Core. Functional Impact (72/100, Moderate) and Avoidance Patterns (71/100, Elevated) further reinforce this picture, suggesting that Cayline's executive difficulties are not merely academic inconveniences but are causing measurable impairment in her daily functioning. The convergence of elevated Social Communication ratings on the RCEP-Core (56/100, Moderate) with the parent's elevated Social Functioning rating on the RFII (75/100) indicates that social difficulties are a significant area of concern, even though the RSCP suggests that specific social skills are relatively less impaired. This may indicate that Cayline's social challenges stem more from anxiety, avoidance, and executive difficulties (e.g., difficulty initiating conversations, organizing social responses) rather than from a fundamental deficit in social awareness or empathy. The elevated Avoidance Patterns (71/100) across parent and Teacher 1, combined with mild-to-moderate Anxiety Features (49/100) and low Academic Self-Belief (29/100), suggests that Cayline may be using avoidance as a coping strategy to manage the anxiety and frustration triggered by academic and social demands that exceed her current executive capacities.

Significant divergences across respondents warrant careful interpretation. Teacher 2 consistently reported lower concerns across multiple domains, including Distractibility (20/100), Sustained Attention (28/100), Mood Variability (3/100), Emotional Intensity (8/100), and Frustration Tolerance (18/100), while Teacher 1 and Parent frequently endorsed moderate-to-elevated concerns in these same areas. This discrepancy may reflect setting-specific factors — Teacher 2's classroom may be more structured, smaller, or more accommodating of Cayline's needs, thereby reducing observable symptoms. Alternatively, Teacher 2 may have a different threshold for concern or may observe Cayline in a context that elicits more optimal functioning. The disagreement between teachers on Help-Seeking (Teacher 1: 75/100 Elevated; Teacher 2: 13/100 Low) is particularly notable and may reflect differential rapport or classroom norms around help-seeking. The discrepancy between Cayline's self-report on the RFI, which indicated only moderate concerns across all domains, and her parent's ratings of elevated Social and Academic Functioning impairment, suggests that Cayline may have limited insight into her difficulties or may minimize her challenges as a protective mechanism. This pattern is consistent with the avoidance and low academic self-belief observed across other instruments.

The ReMynd Index cross-tool averages identify Executive Functioning, Task Initiation, Functional Impact, and Avoidance Patterns as the most impactful domains globally, all falling in the Elevated range. These elevations indicate that Cayline's daily academic, social, and emotional functioning is significantly compromised by her difficulty in organizing, planning, initiating, and sustaining effortful behavior. The moderate elevations in Sustained Attention, Social Communication, Attention Regulation, and Frustration Tolerance further suggest that these difficulties permeate multiple settings and are observable across raters. Clinically, this profile warrants consideration of an Attention-Deficit/Hyperactivity Disorder, Predominantly Inattentive Presentation, given the significant difficulties with task initiation, sustained attention, and distractibility in the absence of hyperactivity or impulsivity. The anxiety features and avoidance patterns may represent either a co-occurring anxiety disorder or a secondary emotional response to chronic academic and social struggles. The low Academic Self-Belief and Motivation & Engagement scores raise concern for the development of a negative academic self-concept, which could further entrench avoidance and reduce academic persistence.

Given this profile, the following recommendations are warranted. First, a comprehensive psychoeducational evaluation, including cognitive and academic achievement testing, is recommended to clarify the nature and severity of Cayline's attentional and executive difficulties and to rule out specific learning disabilities that may be contributing to academic avoidance. Second, direct assessment of anxiety through clinical interview and anxiety-specific rating scales is recommended to determine whether the avoidance patterns and anxiety features meet threshold for an anxiety disorder diagnosis. Third, classroom-based interventions should prioritize executive function support, including explicit instruction in task initiation strategies, breaking tasks into smaller steps, visual schedules, and external cues to support sustained attention. Fourth, given the elevated Social Communication and Social Functioning concerns, a social skills intervention that addresses social confidence, peer engagement, and communication in naturalistic settings is recommended, with particular attention to reducing social anxiety. Fifth, interventions aimed at building Academic Self-Belief and Motivation & Engagement are critical, including strength-based feedback, opportunities for success, and fostering a growth mindset. Finally, given the discrepancy between Cayline's self-perception and her parent's observations, ongoing communication between home and school is essential to ensure consistency in expectations and support, and to monitor Cayline's response to interventions across settings.

ReMynd RAOS · Risk bands: Low (0–25) · Mild (26–50) · Moderate (51–65) · Elevated (66–100) · Scores normalized 0–100 where higher = greater reported concern. · Discrepancy threshold: raw domain spread $\geq$ 1.5 pts.
