Scoring & Report

Rate each reasoning domain 0–4 or mark as Not Observed. Evidence strength reflects confidence in the rating.

RAMRI Disclaimer: RAMRI is a structured qualitative and criterion-referenced reasoning interview. Results must not be represented as standardized scores, age equivalents, grade equivalents, or diagnostic conclusions.

Assessment Context

This RAMRI session was based on a qualitative and criterion-referenced reasoning interview, where the student's mathematical reasoning was assessed through a series of questions and tasks. The session was conducted through a combination of verbal and written responses.

Participation & Emotional Presentation

The student participated in the session with varying levels of engagement and confidence. At times, the student appeared to be unsure of how to approach a problem, while at other times, they demonstrated a clear understanding of the mathematical concepts. No notable anxiety was observed during the session.

Mathematical Reasoning Profile

The student's reasoning profile suggests strengths in mathematical communication, with a rating of 3/4, indicating an ability to express mathematical ideas and thoughts. However, areas such as conceptual understanding, strategy awareness, and verification and reasonableness were rated lower, suggesting difficulties in fully grasping mathematical concepts and evaluating the reasonableness of solutions. The student's metacognition and independence

Performance vs. Reasoning

The student's written work and demonstrated reasoning showed some inconsistencies. While the student was able to complete some tasks correctly, their explanations and justifications often lacked depth and clarity. This discrepancy suggests that the student may be relying on procedural knowledge rather than a deep understanding of mathematical concepts.

Effect of Assessment Conditions

The use of familiar material did not appear to have a significant impact on the student's performance. The student's ability to complete tasks and explain their thinking was not notably better when working with familiar material, suggesting that their understanding of mathematical concepts may be more superficial than deep.

Domain Coverage

The submitted work represented the domains of Geometry, Addition Reasoning, Number Sense, and Subtraction Reasoning. However, several domains, including Multiplicative Reasoning, Division Reasoning, Fractions, Decimals, Percentages, Ratio and Proportional Reasoning, Algebraic Reasoning, Pattern and Relational Reasoning, Mathematical Problem-Solving, Measurement, Spatial Reasoning, Data Interpretation, Statistics, Probability, Money

Transferable Reasoning Strategies

The student's strengths in mathematical communication and metacognition are expected to transfer to unassessed domains, such as Algebraic Reasoning and Mathematical Problem-Solving. For example, the student's ability to express mathematical ideas and thoughts may serve as a foundation for learning algebraic notation and solving mathematical problems. However, this is a hypothesis requiring ongoing observation and may not necessarily translate.

Recommendations

provide opportunities for the student to engage in mathematical discussions and explanation:

×

encourage the student to reflect on their own thinking and problem-solving processes

×

offer support and scaffolding to help the student develop a deeper understanding of mathem

×

provide opportunities for the student to apply mathematical concepts to real-world problems

×

+ Add

Limitations

This is not a standardized assessment.

×

The quality of conclusions depends on the authenticity and context of submitted work.

×

Previously completed work may have involved unrecorded assistance.

×

Transfer evidence is important when interpreting independent understanding.

×

Domains not represented in submitted work cannot be assessed — absence from this report
